

INTRODUCING BLINK VOIP

(Voice Over Internet Protocol)

Once Fred was informed
he could use a regular phone
to make his Blink VoIP calls,
everything was fine..

Blink VoIP 101, Fred.

Travelling through our powerful fibre optic network and the internet, VoIP calls cost less sound better and can be received by virtually any digital device. Now that's telephony, Blink style.

Business communications today is as complex a process to manage as it is costly to afford.

But at Blink Communications, we're well along the road to alleviating both of those issues. With a new telephony technology known as VoIP.

VoIP or Voice Over Internet Protocol, forms the basis for the new telephony medium and one of our most exciting new communication services.

VoIP uses the internet as a voice transmission

system that replaces the traditional wire based phone system. Unlike traditional wire based phone calls, Blink's VoIP calls are digitally compressed and travel through our powerful fibre optic broadband network and the internet. Because the voice data is digitally compressed, each transmission requires less bandwidth and consequently costs much less per call.

Which is a good thing.

In fact there are a great many good things that businesses will gain from the migration to VoIP.

Way too many, in fact, for us to list here.

But if you want to visit our web site at www.blink.ca or talk directly to one of our VoIP consultants, we'll be glad to give you the whole Blink VoIP story.

Once you've heard it, we're certain you'll want to move your business communications system there.

Because VoIP is very much the future of the telephone.

And Blink VoIP is as good as it gets.
